

$$|2H \quad | -c \quad a = \vec{OA} \quad b = \vec{OB}$$

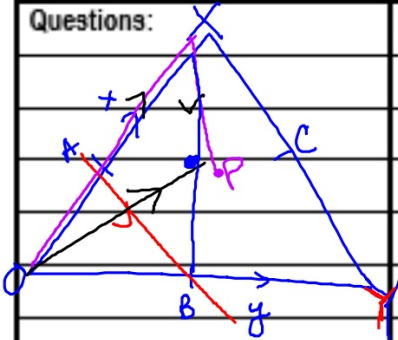

$$1. \vec{PQ} = 4b - 2a$$

$$\begin{aligned} \vec{PQ} &= -\vec{AP} - \vec{OA} + \vec{OB} + \vec{BQ} \\ &= -a - a + b + 3b \\ &= 4b - 2a \end{aligned}$$

$$BQ = 3 \vec{OB}$$

Questions:

$$\vec{OA} = \frac{1}{2}x$$

$$\vec{OB} = \frac{1}{2}y$$

$$\vec{XY} = y - x$$

$$\vec{OC} = \frac{1}{2}(x + y)$$

$$\vec{CB} = \vec{OB} - \vec{OC} = -\frac{1}{2}(x + y)$$

HWp. 425
2, 3, 5

Notes:

b. Find an expression for \vec{AB} in terms of x

What is the relationship between the line XY and the line AB ?

$$\begin{aligned}\vec{AB} &= \vec{AO} + \vec{OB} = -\frac{1}{2}x + \frac{1}{2}y \\ &= \frac{1}{2}(y - x)\end{aligned}$$

Since $\vec{XY} = y - x$ and $\vec{AB} = \frac{1}{2}(y - x)$ then AB is $\frac{1}{2}XY$ and in the same direction as $XY \therefore \vec{AB} \parallel \vec{XY}$

c. P is the point such that $\vec{OP} = \vec{OX} + \frac{2}{3}\vec{XB}$.

Find \vec{OP} . $\vec{OP} = \vec{OX} + \frac{2}{3}\vec{XB}$

$$\begin{aligned}\vec{OP} &= x + \frac{2}{3}(\vec{XO} + \vec{OB}) \\ &= x + \frac{2}{3}(-x + \frac{1}{2}y) \\ &= x - \frac{2}{3}x + \frac{1}{3}y \\ &= \frac{1}{3}(x + y)\end{aligned}$$

d. What can you conclude about point P ?
it is $\frac{2}{3}$ of the way along line OC .
